

CS290 (S0)

Entry level ISDN system telephones

The CS290 offers a low cost ISDN system phone, that fully integrates into the ICT PABX architecture giving the user complete control of the call. Connected through 4 wire structured cabling.

The CS290 comes with five freely programmable keys with dual colour LEDs to indicate the status of important functions e.g. line status, for call forwarding, for headset and team functions, for assigning MSNs and extension status. The direct alphanumerical access to the central telephone directory of the PABX supports central contact data management tasks for workgroups and teams so if phone numbers change, all employees immediately have access to the new direct dialing numbers.

A caller list for ten callers, redialing of the last five numbers dialed and an individual VIP memory for ten more entries gives you a touch of convenience in your day-to-day business routine.

An integrated headset jack allows for flexible and easy headphone use. The headset can be controlled with two programmable keys – "Headset on/off" and – something that is perfect for call centers, for example – with the "Automatic call pick-up" function. The elmeg CS290 also offers direct control of headsets with the signal LED integrated into the microphone earpiece (e.g. Plantronics F142 N "Firefly" or Silicomp "Orbit NC") – it is thus immediately visible whether a call is in progress or not.

Ring-LED. Useful in loud environments: Each call is indicated acoustically by a particularly powerful speaker and also optically by a bright ringing LED.

Highlights

- System specific alphanumeric telephone directory
- Transmission of text messages (UUS1, SMS)
- Programmable function keys
- Busy lamp panel with extension / line buttons
- Receiving messages
- Announcement
- Voice mail button for external Voice Mail Systems
- Login key for team membership
- Headset button
- Autom. call pick-up function key (for use with headsets)
- Day/ night mode
- Team logon/off
